FERTILIZING AND SEEDING OF NEW LAWN

Authorities agree the best time to commence the operation of making a new lawn is as soon after the break of hot summer weather as possible, and with the intention of sowing your new seed during the early part of September. The soil then is warm and an abundance of moisture from rains and night dews assured. These are extremely beneficial to the growth of young grass and allow time for it to become well established before cold weather. As weeds are more prevalent in spring than in the fall, it follows that a long start given to fall sown grass should enable it to withstand the onslaught of weeds lying dormant in the soil and ready to make their spring appearance. Lawns if made and sown during the September should show an excellent turf six to eight weeks later.

FERTILIZER

A moderate application of good lawn fertilizer should be applied to any new area at the rate of 2 lbs. to each 100 sq. ft., and raked into the surface before seeding. We recommend that you make your selection of seed or fertilizer from the following list of materials now available. Mail or telephone your order now. No order is too large or too small and we only ask to be given an opportunity to serve you.

Price list of

GRASS SEED MIXTURES

	Price per	1 to 25 pounds	26 to 100 pounds
<u>Velvet Blond Lawn Mixture</u> (with 15% Bent).....		.60	.58
